Kesesuaian Lahan

Berawan 30°C 13:32 15/01/2024

The dashboard displays several key performance indicators (KPIs) in large, colored boxes: Kualitas Lahan (12), Karakteristik Lahan (22), Kelompok Tanaman (1), and Tanaman (15). Below these are two smaller boxes: Rules (467) and Curah Hujan (156). A central image shows a green, terraced agricultural landscape. On the left, there's a vertical sidebar with icons for different system components. At the bottom, a Windows taskbar shows the date (15/01/2024) and time (13:32).

This page lists five categories of land quality: eh (Bahaya Erosi), fh (Bahaya Banjir), g (Gambut), lp (Penyilapan Lahan), and nr (Retensi Hara). Each entry has a 'Ubah' (Edit) and 'Hapus' (Delete) button. There are search bars at the bottom for both the category names and descriptions. The Windows taskbar at the bottom includes the date (15/01/2024) and time (13:33).

The screenshot shows a dark-themed web application interface. At the top, there's a header bar with the title "InPrivate (2)" and a search bar containing the URL "https://sistem-kesesuaian-lahan.com/kelas". The main content area has a sidebar on the left with various icons and sections like "Kelas", "Ordo", "N", "S", and "S". A modal dialog box is open in the center, titled "Form Kelas". It contains fields for "Ordo" (with value "S"), "Kelas" (with placeholder "Kelas"), and "Deskripsi" (with placeholder "Deskripsi"). Below these fields are two buttons: "Simpan" (in a dark button) and "Batal". To the right of the modal, there's a list of existing records with columns for "Pencarian", "Ubah", and "Hapus". At the bottom of the page, there are search bars for "Search Ordo", "Search Kelas", and "Search Deskripsi", along with navigation buttons for "Sebelumnya" and "Selanjutnya".

Musim Tanam

Ubah Hapus Rules

The screenshot shows a modal window titled "Form Tanaman" over a dark-themed application interface. The modal has a header "Form Tanaman" with a close button. Below it is a section titled "Kelompok Tanaman" containing a dropdown menu set to "Tanaman Pangan". The main input field is labeled "Tanaman" and contains the placeholder text "Tanaman". Underneath is a section titled "Musim Tanam" with two radio buttons: "Sepanjang Tahun" (selected) and "Musiman". At the bottom right of the modal are two buttons: "Simpan" (highlighted in black) and "Batal". The background of the application shows a sidebar with categories like "Tanaman", "Kelompok Tanaman", and "Musim Tanam", and a list of entries such as "Tanaman Pangan", "Kacang Hijau", and "Musiman".

Knowledge Rules

The screenshot shows a web application titled "Sistem Kesesuaian Lahan" (Soil Suitability System) with a sidebar containing various icons. The main page displays a list of rules for "Gandum" (Wheat). Each rule is presented as an if-then statement. The interface includes a search bar at the bottom and a "Hapus Semua" (Delete All) button on the right.

Tanaman	Rules
Gandum	IF Temperatur rerata >= 12 AND Temperatur rerata < 23 THEN Kelas = Sangat Sesuai (S1)
Gandum	IF Temperatur rerata >= 10 AND Temperatur rerata < 12 OR Temperatur rerata BETWEEN 23 AND 25 THEN Kelas = Cukup Sesuai (S2)
Gandum	IF Temperatur rerata < 10 OR Temperatur rerata > 25 THEN Kelas = Tidak Sesuai (N)
Gandum	IF Curah hujan >= 350 AND Curah hujan < 1250 THEN Kelas = Sangat Sesuai (S1)
Gandum	IF Curah hujan >= 250 AND Curah hujan < 350 OR Curah hujan >= 1250 AND Curah hujan < 1500 THEN Kelas = Cukup Sesuai (S2)

Decision Support System

The screenshot shows the main interface of the Decision Support System. On the left, there is a vertical sidebar with various icons. The main area is divided into sections: 'Temperatur (tc)' with a 'Temperatur rerata' input field containing 'Temperatur rerata'; 'Ketersediaan Air (wa)' with 'Curah hujan' and 'Lama bulan kering' input fields both containing 'Curah hujan'; and a 'Tanaman Pangan' list on the right. The 'Tanaman Pangan' list includes: Gandum, Iles, Jagung, Kacang Hijau, Kacang Tanah, Kacang Tunggak, Kedelai, Padi Gogo, Padi Sawah Lebak, Padi Sawah Tadah Hujan, Padi Sawah, and Sorgum. To the right of the list is a 'Legenda' section with four color-coded boxes: S1 Sangat Sesuai (green), S2 Cukup Sesuai (blue), S3 Sesuai Marginal (yellow), and N Tidak Sesuai (red).

This screenshot shows the same interface as above, but with input values entered. In the 'Temperatur (tc)' section, 'Temperatur rerata' now contains '20'. In the 'Ketersediaan Air (wa)' section, both 'Curah hujan' and 'Lama bulan kering' now contain 'Curah hujan'. The 'Tanaman Pangan' list has several items highlighted with checkmarks and dropdown arrows: Gandum, Kacang Tanah, Kedelai, Padi Sawah Lebak, Padi Sawah Tadah Hujan, and Padi Sawah. The 'Legenda' section remains the same.

| Session Variables
| -----
|
| 'sess_driver'
|
|
|   The storage driver to use: files, database, redis, memcached
|
|
| 'sess_cookie_name'
|
|
|   The session cookie name, must contain only [0-9a-z_-] characters
|
|
| 'sess_expiration'
|
|
|   The number of SECONDS you want the session to last.
|
|   Setting to 0 (zero) means expire when the browser is closed.
|
|
| 'sess_save_path'
|
|
|   The location to save sessions to, driver dependent.
|
|
|   For the 'files' driver, it's a path to a writable directory.
|
|   WARNING: Only absolute paths are supported!
```

```
|  
| For the 'database' driver, it's a table name.  
| Please read up the manual for the format with other session drivers.  
|  
|  
| IMPORTANT: You are REQUIRED to set a valid save path!  
|  
|  
| 'sess_match_ip'  
|  
| Whether to match the user's IP address when reading the session data.  
|  
|  
| WARNING: If you're using the database driver, don't forget to update  
| your session table's PRIMARY KEY when changing this setting.  
|  
|  
| 'sess_time_to_update'  
|  
| How many seconds between CI regenerating the session ID.  
|  
|  
| 'sess_regenerate_destroy'  
|  
| Whether to destroy session data associated with the old session ID  
| when auto-regenerating the session ID. When set to FALSE, the data  
| will be later deleted by the garbage collector.  
|  
|  
| Other session cookie settings are shared with the rest of the application,

/*  
|-----  
| Output Compression  
|-----  
|  
| Enables Gzip output compression for faster page loads. When enabled,  
| the output class will test whether your server supports Gzip.  
| Even if it does, however, not all browsers support compression  
| so enable only if you are reasonably sure your visitors can handle it.  
|  
| Only used if zlib.output_compression is turned off in your php.ini.  
| Please do not use it together with httpd-level output compression.  
|  
| VERY IMPORTANT: If you are getting a blank page when compression is enabled  
| it  
| means you are prematurely outputting something to your browser. It could  
| even be a line of whitespace at the end of one of your scripts. For
```

```
| compression to work, nothing can be sent before the output buffer is called  
| by the output class. Do not 'echo' any values with compression enabled.  
  
|  
*/  
  
$config['compress_output'] = FALSE;  
  
/*  
|-----  
| Master Time Reference  
|-----  
|  
| Options are 'local' or any PHP supported timezone. This preference tells  
| the system whether to use your server's local time as the master 'now'  
| reference, or convert it to the configured one timezone. See the 'date  
| helper' page of the user guide for information regarding date handling.

/*
| -----
| DATABASE CONNECTIVITY SETTINGS
|
| -----
|
| This file will contain the settings needed to access your database.
|
|
| For complete instructions please consult the 'Database Connection'
| page of the User Guide.
|
|
| -----
|
| EXPLANATION OF VARIABLES
|
| -----
|
|
| ['dsn']      The full DSN string describe a connection to the database.
|
| ['hostname'] The hostname of your database server.
|
| ['username'] The username used to connect to the database
|
| ['password'] The password used to connect to the database
|
| ['database'] The name of the database you want to connect to
```

```
| ['dbdriver'] The database driver. e.g.: mysqli.  
|  
|     Currently supported:  
|  
|         cubrid, ibase, mssql, mysql, mysqli, oci8,  
|  
|         odbc, pdo, postgre, sqlite, sqlite3, sqlsrv  
|  
| ['dbprefix'] You can add an optional prefix, which will be added  
|  
|         to the table name when using the Query Builder class  
|  
| ['pconnect'] TRUE/FALSE - Whether to use a persistent connection  
|  
| ['db_debug'] TRUE/FALSE - Whether database errors should be displayed.  
|  
| ['cache_on'] TRUE/FALSE - Enables/disables query caching  
|  
| ['cachedir'] The path to the folder where cache files should be stored  
|  
| ['char_set'] The character set used in communicating with the database  
|  
| ['dbcollat'] The character collation used in communicating with the  
database  
|  
|  
|     NOTE: For MySQL and MySQLi databases, this setting is only  
used  
|  
|  
|     as a backup if your server is running PHP < 5.2.3 or MySQL <  
5.0.7  
|  
|  
|     (and in table creation queries made with DB Forge).  
|  
|  
|     There is an incompatibility in PHP with  
mysql_real_escape_string() which  
|  
|  
|     can make your site vulnerable to SQL injection if you are  
using a  
|  
|  
|     multi-byte character set and are running versions lower than  
these.  
|  
|  
|     Sites using Latin-1 or UTF-8 database character set and  
collation are unaffected.  
|  
| ['swap_pre'] A default table prefix that should be swapped with the  
dbprefix
```

```
| ['encrypt'] Whether or not to use an encrypted connection.  
|  
|      'mysql' (deprecated), 'sqlsrv' and 'pdo/sqlsrv' drivers accept  
TRUE/FALSE  
|      'mysqli' and 'pdo/mysql' drivers accept an array with the  
following options:  
|  
|  
|      'ssl_key'      - Path to the private key file  
|  
|      'ssl_cert'     - Path to the public key certificate file  
|  
|      'ssl_ca'       - Path to the certificate authority file  
|  
|      'ssl_capath'   - Path to a directory containing trusted CA  
certificates in PEM format  
|  
|      'ssl_cipher'   - List of *allowed* ciphers to be used for the  
encryption, separated by colons ':'  
|  
|      'ssl_verify'   - TRUE/FALSE; Whether verify the server  
certificate or not ('mysqli' only)  
|  
|  
| ['compress'] Whether or not to use client compression (MySQL only)  
|  
| ['stricton'] TRUE/FALSE - forces 'Strict Mode' connections  
|  
|      - good for ensuring strict SQL while developing  
|  
| ['ssl_options'] Used to set various SSL options that can be used when  
making SSL connections.  
|  
| ['failover'] array - A array with 0 or more data for connections if the  
main should fail.  
|  
| ['save_queries'] TRUE/FALSE - Whether to "save" all executed queries.  
|  
|      NOTE: Disabling this will also effectively disable both  
|  
|      $this->db->last_query() and profiling of DB queries.  
|  
|      When you run a query, with this setting set to TRUE (default),
```

```
|           CodeIgniter will store the SQL statement for debugging
purposes.

|           However, this may cause high memory usage, especially if you
run

|           a lot of SQL queries ... disable this to avoid that problem.

|           The $active_group variable lets you choose which connection group to
make active. By default there is only one group (the 'default' group).

|           The $query_builder variables lets you determine whether or not to load
the query builder class.

*/
$active_group = 'default';

$query_builder = TRUE;

    'dbdriver' => 'mysqli',
    'dbprefix' => '',
    'pconnect' => FALSE,
    'db_debug' => (ENVIRONMENT !== 'production'),
```

```
'cache_on' => FALSE,  
'cachedir' => '',  
'char_set' => 'utf8',  
'dbcollat' => 'utf8_general_ci',  
'swap_pre' => '',  
'encrypt' => FALSE,  
'compress' => FALSE,  
'stricton' => FALSE,  
'failover' => array(),  
'save_queries' => TRUE  
);
```

routes.php

```
<?php  
defined('BASEPATH') OR exit('No direct script access allowed');  
  
/*  
| -----  
| URI ROUTING  
| -----  
| This file lets you re-map URI requests to specific controller functions.  
|  
| Typically there is a one-to-one relationship between a URL string  
| and its corresponding controller class/function. The segments in a  
| URL normally follow this pattern:  
|  
|     example.com/class/method/id/  
|  
| In some instances, however, you may want to remap this relationship  
| so that a different class/function is called than the one  
| corresponding to the URL.  
|  
| Please see the user guide for complete details:  
|  
|     https://codeigniter.com/user\_guide/general/routing.html
```

```

|-----|
| RESERVED ROUTES
|-----|
|
| There are three reserved routes:
|
| $route['default_controller'] = 'welcome';
|
| This route indicates which controller class should be loaded if the
| URI contains no data. In the above example, the "welcome" class
| would be loaded.
|
| $route['404_override'] = 'errors/page_missing';
|
| This route will tell the Router which controller/method to use if those
| provided in the URL cannot be matched to a valid route.
|
| $route['translate_uri_dashes'] = FALSE;
|
| This is not exactly a route, but allows you to automatically route
| controller and method names that contain dashes. '-' isn't a valid
| class or method name character, so it requires translation.
| When you set this option to TRUE, it will replace ALL dashes in the
| controller and method URI segments.
|
| Examples: my-controller/index -> my_controller/index
|           my-controller/my-method -> my_controller/my_method
*/
$route['default_controller'] = 'dashboard';
$route['404_override'] = '';
$route['translate_uri_dashes'] = FALSE;
